## The story behind InkPrint

InkPrint was inspired by my daughter, Kiki.

To look after her eyes, Kiki does her reading on an e-ink reader. One day she pointed out that if we cared about the environment, we shoul be wasting less paper — so why not "print" straight to the e-reader instead?

The idea turned out to be simple and practical. Every computer and phone already knows how to print, so printing to an e-ink reader need no changes to the apps and systems people already use: pick the printer, press Print, and the document lands on the reader instead of on paper. That is how this app came to be.

Thank you, Kiki. 💚

### 项目缘起

InkPrint 的灵感来自我的女儿 Kiki。

为了保护视力，Kiki 一直用电纸书阅读。有一天她说，为了保护环境，我们应该少浪费一些纸张，那为什么不把要打印的东西直接“打印”到电纸书上呢?

这个想法简单又实用。电脑和手机本来就会打印，打印到电纸书不需要改造任何已有的应用和信息系统：选中打印机，点一下打印，文档就会出现在电纸书上，而不是纸上，既方便又环保。于是就有了这个 App。

谢谢你，Kiki。💚

## How it works

```
macOS / Windows / Linux / iOS / Android
        │  print via IPP over WiFi
        ▼
  InkPrint (Android app on BOOX)
  ├── IPP/HTTP server  (port 6310)
  ├── mDNS/Bonjour advertiser  (_ipp._tcp + AirPrint subtype)
  └── Saves PDF to  /Documents/InkPrint/
```

- **IPP 2.0** server implemented in Rust ( `inkprint-core` crate)
- **AirPrint** compatible — macOS, iOS, and iPadOS discover it with zero configuration
- **Bonjour/mDNS** advertisement broadcasts both `_ipp._tcp` and `_universal._sub._ipp._tcp` so all major platforms can auto-discover the printer
- **Pure PDF** storage — every print job is saved as a PDF file, ideal for e-ink reading
- Rust core compiled to `aarch64-linux-android` via **cargo-ndk**, bridged to Kotlin via **UniFFI**
